

# Advanced graphics: practical 2 solutions

Dr Colin S. Gillespie

This practical aims to guide you through some of the key ideas in ggplot2. As with the first practical, feel free to experiment. Some of the functions introduced in this practical haven't been explicitly covered in the notes. Use the built-in R help or the ggplot2 help pages at <http://had.co.nz/ggplot2/> as needed.

## 1 Introduction

To begin, load the library:

```
library("ggplot2")
```

and the mpg data set

```
data(mpg)
dim(mpg)
```

## 2 Basic plots

The aim of this section is to recreate the graphics in figure 1. Feel free to experiment.

1. Figure 1: Create a scatter plot of engine displacement, `displ`, against highway mpg, `hwy`. To get started:

```
ggplot(data=mpg, aes(x=displ, y=hwy)) +
  geom_point() + xlab("Displacement")
```

Now add a dashed loess line and change the y-axis label. Hint: try `stat_smooth` and `xlab('New label')`.

```
g = ggplot(data=mpg, aes(x=displ, y=hwy))
```

2. Figure 2: highlight the Audi cars with a slightly larger red circle.

```
g1 = g + geom_point() + stat_smooth(linetype=2) +
  xlab("Displacement") + ylab("Highway mpg")
```

3. Figure 3: Using `stat_smooth`, add a loess line conditional on the drive.

```
g2 = g1 + geom_point(data=subset(mpg, manufacturer=="audi"),
  aes(x=displ, y=hwy),
  colour="red", size=4, alpha=0.4)
```

Figure 1: Graphics for section 1.

Figure 2: Graphics for section 1.

Figure 3: Graphics for section 1.

### 3 Over plotting

Scatter plots are very useful. However, when we have a large data set, points will be plotted on top of each other obscuring the relationship. We call this problem over plotting. There are a few techniques we can use to help, although the best solution is often problem specific.

To begin with we will create an example data frame:

```
## If your computer is slow when plotting
## reduce the value of n
n = 20000
x1 = signif(matrix(rnorm(n), ncol=2), 2)
x2 = signif(matrix(
  rnorm(n, mean=3, sd=1.5), ncol=2), 2)
x = rbind(x1, x2)
df = data.frame(x=x[,1], y=x[,2])
```

We can create a simple scatter plot of this data using the following commands:

```
h= ggplot(df) + geom_point(aes(x, y))
```

This plot isn't particularly good. Try to improve it by using a combination of:

- changing the transparency level: `alpha`;
- change the shape: `shape=1` and `shape='.'`
- use some jittering - `geom_jitter`.
- adding a contour to the plot using `stat_density2d`.
- What does

```
h + stat_density2d(aes(x,y, fill=..density..),
  contour=FALSE, geom="tile")
```

do?

- What does `stat_bin2d()` and `stat_binhex()` do<sup>1</sup> - add it to the plot to find out! Try varying the parameters `bins` and `binwidth`.

Figure 4: A scatter plot that suffers from over plotting.

### 4 Displaying distributions

The diamonds data set contains the prices and other attributes of almost 54,000 diamonds. It is a data frame with 53,940 rows and 10 variables. First, load the diamonds data set:

```
data(diamonds)
```

and look at the help file:

<sup>1</sup> To use `stat_binhex` you may need to install the `hexbin` package.

?diamonds

We can construct a histogram of diamond depth using the following commands:

```
il = ggplot(data=diamonds) +  
  geom_histogram(aes(x=depth))
```

to get figure 5. Let's experiment a bit.

1. Change the binwidth in the geom\_histogram. What value do you think is best?
2. What happens when you set colour=cut in the geom\_histogram aesthetic? What other options can you change?<sup>2</sup>
3. Try geom\_density. Set fill=cut and change the alpha value.
4. Try geom\_boxplot.

Figure 5: Histogram of the diamond data set.

<sup>2</sup>Look at the geom\_histogram help page: [http://had.co.nz/ggplot2/geom\\_histogram.html](http://had.co.nz/ggplot2/geom_histogram.html)

## Solutions

Solutions are contained within this package:

```
library(nclRggplot2)  
vignette("solutions2", package="nclRggplot2")
```
