## Programming: practical 1 solutions

## Dr Colin S. Gillespie

In the questions below, the important part is **understanding** what's going on rather than just typing the R commands. If you are unsure of what's going on, please ask.

- 1 Practice questions
- 1. Basic functions

```
v = 5
Fun1 = function() {
    v = 0
    return(v)
}
Fun1()
## [1] 0
v
```

(a) Why does the final line return 5 and not o.

```
## Fun1 uses the local variable v
```

(b) Delete line 3 in the above piece of code. Now change Fun1 to allow v to be passed as an argument, i.e. we can write Fun1(5). Call this function to make sure it works.

```
Fun1 = function(v) {
    return(v)
}
Fun1(10)
## [1] 10
```

(c) Now make the argument in Fun1 have a default value of 0.

```
Fun1 = function(v = 0) {
    return(v)
}
```

2. Default arguments:

```
Fun2 = function(x = 10) {
    return(x)
}
```

```
Fun3 = function(x) {
  return(x)
```

(a) Why does this work:

```
Fun2()
```

but this raises an error

```
## Fun1()} has a default argument
```

(b) Change Fun2 so that it returns  $\sqrt{x}$ .

```
Fun2 = function(x = 10) {
   return(sqrt(x))
```

3. if statements.

```
Fun4 = function(x) {
   if (x == 5) {
       y = 0
   } else {
       y = 1
    return(y)
```

- (a) Change Fun4 so that it:
  - returns 1 if x is positive;
  - returns -1 if *x* is negative;
  - returns o if x is zero.

```
Fun4 = function(x) {
    rtn_value = 0
    if (x > 0) {
       rtn_value = 1
    } else if (x < 0) {
        rtn_value = -1
    return(rtn_value)
```

4. for loops.

```
total = 0
for (i in 1:5) {
   total = total + i
}
total
## [1] 15
```

The for loop above calculates

$$\sum_{i=1}^{5} i$$

(a) What is the final value of total in the above piece of code?

```
total
## [1] 15
```

(b) Change the above loop to calculate the following summations:

(i) 
$$\sum_{i=1}^{20} (i+1)$$

```
total = 0
for (i in 1:20) {
   total = total + (i + 1)
}
total
## [1] 230
```

$$(ii) \sum_{j=-10}^{15} j$$

```
total = 0
for (j in -10:15) {
  total = total + j
}
total
## [1] 65
```

5. More for loops:

```
a = 2
total = 0
for (blob in a:5) {
   total = total + blob
```

(a) Delete line 1. Now put the above code in a function called Fun5, where a is passed as an argument, i.e. we can call Fun5(1)

```
Fun5 = function(a) {
    total = 0
    for (blob in a:5) {
        total = total + blob
    }
    return(total)
}
Fun5(1)
## [1] 15
```

(b) Alter the code so that the for loop goes from a to b, rather than a to 5. Allow b to be passed as an argument, i.e. we can call Fun5(1,5).

```
Fun5 = function(a, b) {
   total = 0
    for (blob in a:b) {
        total = total + blob
    }
    return(total)
Fun5(1, 5)
## [1] 15
```

(c) Change Fun5 so that it has default arguments of a=1 and b=10.

```
Fun5 = function(a = 1, b = 10) {
    total = 0
    for (blob in a:b) {
        total = total + blob
    return(total)
Fun5(5)
## [1] 45
```

## Solutions

Solutions are contained within this package:

```
library(nclRprogramming)
vignette("solutions1", package = "nclRprogramming")
